RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 40 pages. Original publisher: Ann Arbor, Mich. : U. S. Dept. of Commerce, National Oceanic and Atmospheric Administration, Environmental Research Laboratories, Great Lakes Environmental Research Laboratory, 1981 OCLC Number: gp 82027660 Subject: Organic compounds -- Synthesis. Excerpt: . . . This class of compounds, consisting of more than 200 theoretical iso-mers ( less than one-half of which are believed to be present in any quan-tity in the environment ), is of current concern in Lake the Great Lakes. Michigan sport fish have concentrations many times higher than the 5-ppm Food and Drug Administration level considered safe for human consumption. This report applies the calibrated DDT model to the PCBs, attempting to gain insight into their rate of removal from a Lake Michigan-like ecosystem. The National Research Council ( NRC ) recently published a report on PCBs in the environment ( NRC, 1979 ) that has been used as a major source of information for this report. Unfortunately, information on PCBs is predominantly reported in terms of commercially available mixtures, called AroclorsQ in the United States. These are coded such that the last two digits represent the weight percent chlorine in the mixture ( e. g. , 1254 contains 54 percent chlorine, an average of five chlorines per molecule ). Figure 4 illustrates the approximate The modeling of these mixtures is very composition of the Aroclorsm. unsatisfying because of the range of characteristics and, consequently, environmental pathways that are smoothed over in this averaging process. Also, it appears that a major photodecomposition reaction is dechlorination, which produces another PCB. Improvements in ecosystem simulation models can only come when sufficient information is available to model the individual isomers. 5 0-. 6 4 5-. 4 0-: : E 35-8 3 0-z...
